# PAY-PER-USE: **FINANCIAL FLEXIBILITY** FOR SMES

# GROWTH WITHOUT OVER-LEVERAGING THE BUSINESS

## Clients

High Demand for  
OPEX models

## OEMs

Limitation by CAPEX  
increases financing need

## Investors

Missing asset  
lifecycle transparency

Legacy system  
limitations

Increased back office  
complexity and costs

Manual payments  
lead to high costs

# THE IOT PAYMENT INFRASTRUCTURE FOR DIGITAL BUSINESS

# CashOnLedger's Payment Engine combined with Payment Adapter offers a fully automated and compliant payment solution!

## Machine data extraction

CashOnLedger works with leading semiconductors and startups to extract data from the machines. Hence necessary information can be gathered.

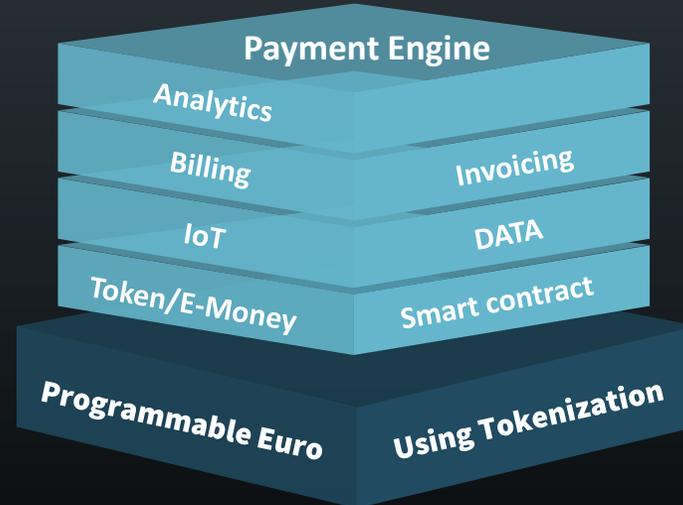

## Automated Billing

Based on the machine data, an algorithm is triggered which calculates the depreciation of the asset and generates the invoice for the client in leading ERP systems (SAP, Oracle, etc.)

CashOnLedger

## Insurance

IoT devices, unchangeable data and smart contracts have an impact on the development of risk assessments. Insurers can rely upon secure data to create individual insurance packages.

## Automated Payment

Being connected to bank accounts and having created the programmable EUR, CashOnLedger also triggers the automated settlement process to reduce manual accounting efforts

# MULTIPARTY BUSINESS ORCHESTRATION IS NECESSARY

## PayPerUse & Asset Tokenization

### Asset Based Lending (ABL) with Asset Baked Tokens (ABT)

# Differentiation between programmable payment & money

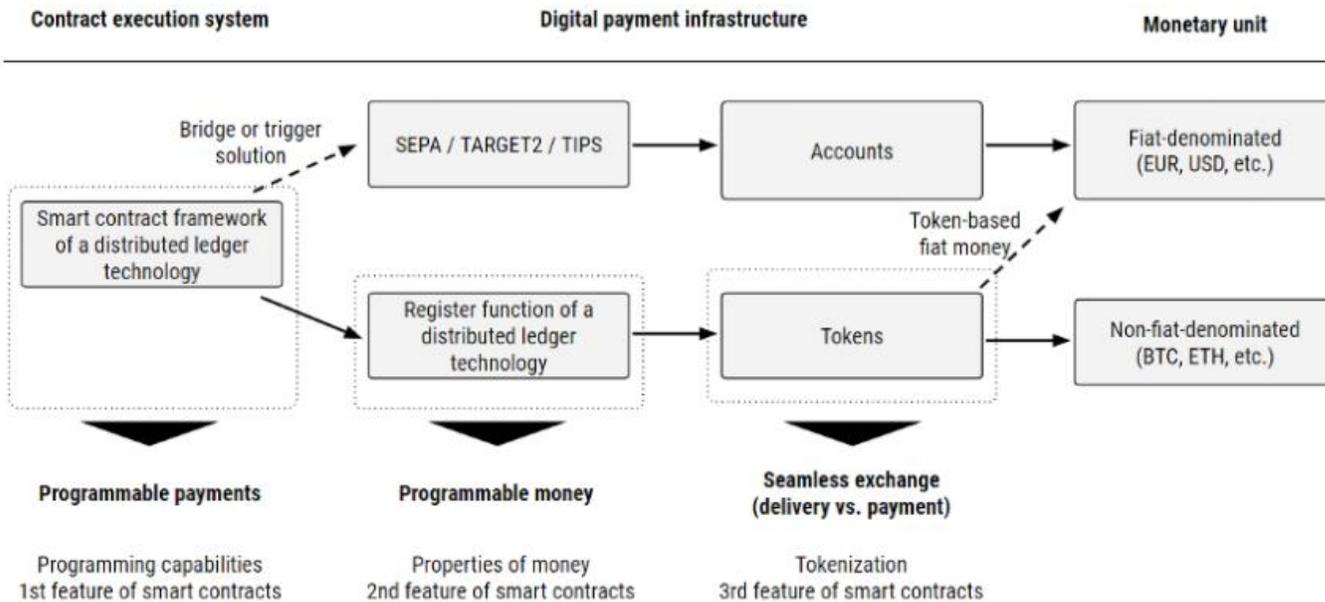

Figure 1: Programmable payment value chain. Integrating different dimensions of programmability with underlying features of smart contracts.

## Contract Execution System

The first step in our programmable payment value chain is a contract that automatically triggers a payment. For example, any business logic or a business process can execute such contracts.

## Digital Payment Infrastructure

It can either be processed using DLT or — with the help of a bridge or trigger solution — using conventional infrastructure such as SEPA, TARGET2 or TIPS. The digital payment infrastructure also determines whether the payment asset is account- or token-based (3rd feature of smart contracts). Payments based on accounts require the identification of the account holder. Payments based on tokens require the ability to verify the validity of the token. Tokens realize their full potential when they can be exchanged for other tokens, such as tokenized assets or services. This enables the seamless exchange with immediate transaction finality, also known as “delivery vs. payment”.

## Monetary Unit

- Central bank digital currencies (CBDC)
- Synthetic central bank digital currencies (sCBDC)
- DLT-based commercial bank money
- DLT-based e-money
- FIAT-pegged Stablecoins
